

Keep the reason with the trade

Traders need continuity between preparation, action and review.

- Charts, chats and notes fragment the decision.
- Entry rationale and risk rules are easy to lose.
- Outcomes alone do not explain decision quality.

01

Prepare

Market evidence
Strategy rules

02

Act

Plan authority
Paper execution

03

Review

Journal facts
Learning proposals

Concept diagram: keep the reasoning with the decision.

A personal AI trading operating system

The product connects the trader's workflow around durable context.

- One place for strategies, knowledge and Journal history.
- An Agent that explains stored facts and drafts supported actions.
- Paper-first decisions with explicit authority.
- A vision of better assistance, grounded in today's bounded product.

Follow one decision

A reviewable record connects a setup to its eventual learning.

- Inspect strategy rules and market evidence.
- Follow a confirmed opportunity into eligibility and plan authority.
- Compare planned terms with recorded fills in the Journal.
- Ask the Agent to explain the decision and missing evidence.

Observe + detect

Approved rules and usable evidence

Review a Candidate

Recorded opportunity and assessment

Authorize + check

Exact plan and current deterministic gates

Execute + review

Paper or gated demo facts in the Journal

Six connected workspaces

Each destination answers a practical trader question.

- Dashboard: what needs attention? Agent: what does the record mean?
- Strategies: what are my rules? Knowledge: where is my reference material?
- Journal: what happened and what can I learn?
- Settings: what are my risk, account and notification boundaries?

Dashboard

What needs attention?

Agent

What does the record mean?

Journal

What happened?

Strategies

What are my rules?

Knowledge

Where are my sources?

Settings

What are my boundaries?

An assistant that can show its sources

Agent explanations are tied to recorded facts and scoped reference material.

- Reads exact strategy, trade and assessment context.
- Separates planned terms from actual fills and protection.
- Shows source references and missing evidence.
- Produces drafts with separate Confirm/Reject controls.

Agent conversation

Scoped tools + SQL lexical retrieval

Grounded context

Facts, source references and gaps

Knowledge service

Explicit save → embeddings
→ Qdrant search

Separate decision

Confirm/Reject invokes domain services

Diagram summary · [inspect the complete source-verified flow](#)

Control belongs to application services

Deterministic checks govern an action after the assistant has explained it.

- Exact immutable plan revision and content hash.
- Eligibility, account exposure and deterministic risk checks.
- Freshness, expiry, permissions and kill-switch enforcement.
- Durable command identity, reservations and worker fencing.

Exact content

Immutable plan revision + hash

Current gates

Risk, 1R policy, freshness and expiry

Dispatch control

Durable command, reservations and fencing

Recorded result

Fill facts; uncertainty holds for review

One web app, an independent worker

Interactive requests and background monitoring share durable records but have separate lifecycles.

- Next.js on Vercel; FastAPI on Render.
- Independent Render paper worker for Watcher and Telegram.
- PostgreSQL for durable facts; Redis for applicable security/cache.
- Public Binance/Bybit evidence and separately governed external channels.

Memory that supports review

Persisted history supports learning proposals without silently changing authority.

- Conversations, playbooks and strategy versions preserve context.
- Journal facts retain decision and execution lineage.
- Review distinguishes observations, inference and suggestions.
- Promotion needs validation, paper evidence and a human decision.

Application memory

Conversations, playbooks and strategy history

Decision record

Evidence, plans, fills and Journal lineage

Proposed learning

Exact validation and supported paper evidence

Human promotion

Governed version lifecycle update

Evidence we can describe precisely

Deployment, notification receipt, simulation and exchange orders establish different things.

- Supplied: Render API/worker verified on b58beda; migration a6manualdemo001 applied.
- Supplied: Watcher Telegram notification received; Nested BTC internal paper fill and Journal exist.
- Supplied: BloFin demo account sync succeeded; native order acceptance is still pending.
- GitHub checked: Vercel success; full acceptance CI #783 in progress at the recorded check.

SUPPLIED

Deployed baseline

Render API + worker: b58beda

Migration: a6manualdemo001

SUPPLIED

Demonstrated parts

Received Watcher notification

Internal paper fill + Journal

Demo account sync

GITHUB CHECKED

Release state

Vercel: success

Full CI #783: in progress at check

ACCEPTANCE GAP

Native demo order evidence

Fill and protection acceptance remains pending.

Engineering quality through explicit contracts

Quality is demonstrated by scoped checks and inspectable failure behavior.

- Typed API and action contracts; tenant/user scoping.
- Immutable evidence and auditable plan/execution identities.
- Backend unit/integration checks and frontend/browser checks.
- Focused development CI separated from full release acceptance.

Typed boundaries

API schemas and scoped actions

Durable facts

Plans, receipts and Journal lineage

Focused checks

Backend, frontend and browser layers

Separate acceptance

Exact-SHA full release gate

Test framework presence and prior results do not imply every current gate passed.

Bounded execution, honest limitations

The current scope is narrow enough to explain and test.

- SFP research/detection exists; automatic SFP execution is unsupported.
- PR220: owner-confirmed BTC MARKET demo entry, one full target.
- No limit entry or complete demo exit/PnL/funding reconciliation in that capability.
- Fresh SFP, Journal repair and native demo acceptance remain separate gates.

CURRENT MANUAL DEMO SCOPE

BTC · MARKET · one full target

Owner preview and exact confirmation

Separate staging-only gate

Native acceptance pending

Limit entry, manual exit and complete exit/PnL/funding reconciliation remain outside this capability.

Grow from evidence

The next steps improve completeness and evaluated assistance.

- Complete exact-release and fresh operational acceptance.
- Finish supported exchange outcomes before expanding execution scope.
- Evaluate grounding, context continuity and real-device voice.
- Add validated strategy families and governed learning evidence.

01**Accept**

Finish release and operational evidence

02**Reconcile**

Complete supported venue outcomes

03**Evaluate**

Grounding, context and real-device voice

04**Expand**

Validated strategies and governed learning
